

Information Security and Employee Behaviour: How to Reduce Risk Through Employee Education, Training and Awareness

Research suggests that between 60-75% of all information security incidents are the result of a lack of knowledge and/or understanding amongst an organizations own staff. And yet the great majority of money spent protecting systems is focused on creating technical defences against external threats. Angus McIlwraiths book explains how corporate culture affects perceptions of risk and information security, and how this in turn affects employee behaviour. He then provides a pragmatic approach for educating and training employees in information security and explains how different metrics can be used to assess awareness and behaviour. Information security awareness will always be an ongoing struggle against complacency, problems associated with new systems and technology, and the challenge of other more glamorous and often short term priorities. Information Security and Employee Behaviour will help you develop the capability and culture that will enable your organization to avoid or reduce the impact of unwanted security breaches.
